Abstract

Digital Hospital Management: A Hospital Management System is a software application that automates and manages the daily operations of a hospital.

Centralized Data Management: It securely stores and manages patient records, doctor details, appointments, billing, and medical reports in a single database.

Improved Efficiency: The system reduces paperwork, minimizes errors, saves time, and enables quick access to information for hospital staff.

Better Healthcare Services: It enhances patient care, improves communication between departments, and provides a secure, reliable, and user-friendly solution for hospital management.

1. Existing System – Disadvantages

- 1.The manual system is time-consuming and difficult to manage.
- 2.Patient records can be lost or damaged easily.
- 3.Searching and updating information takes more time.
- 4.Billing and appointment management are prone to human errors.
- 5.Maintaining large amounts of paper records requires more storage space.

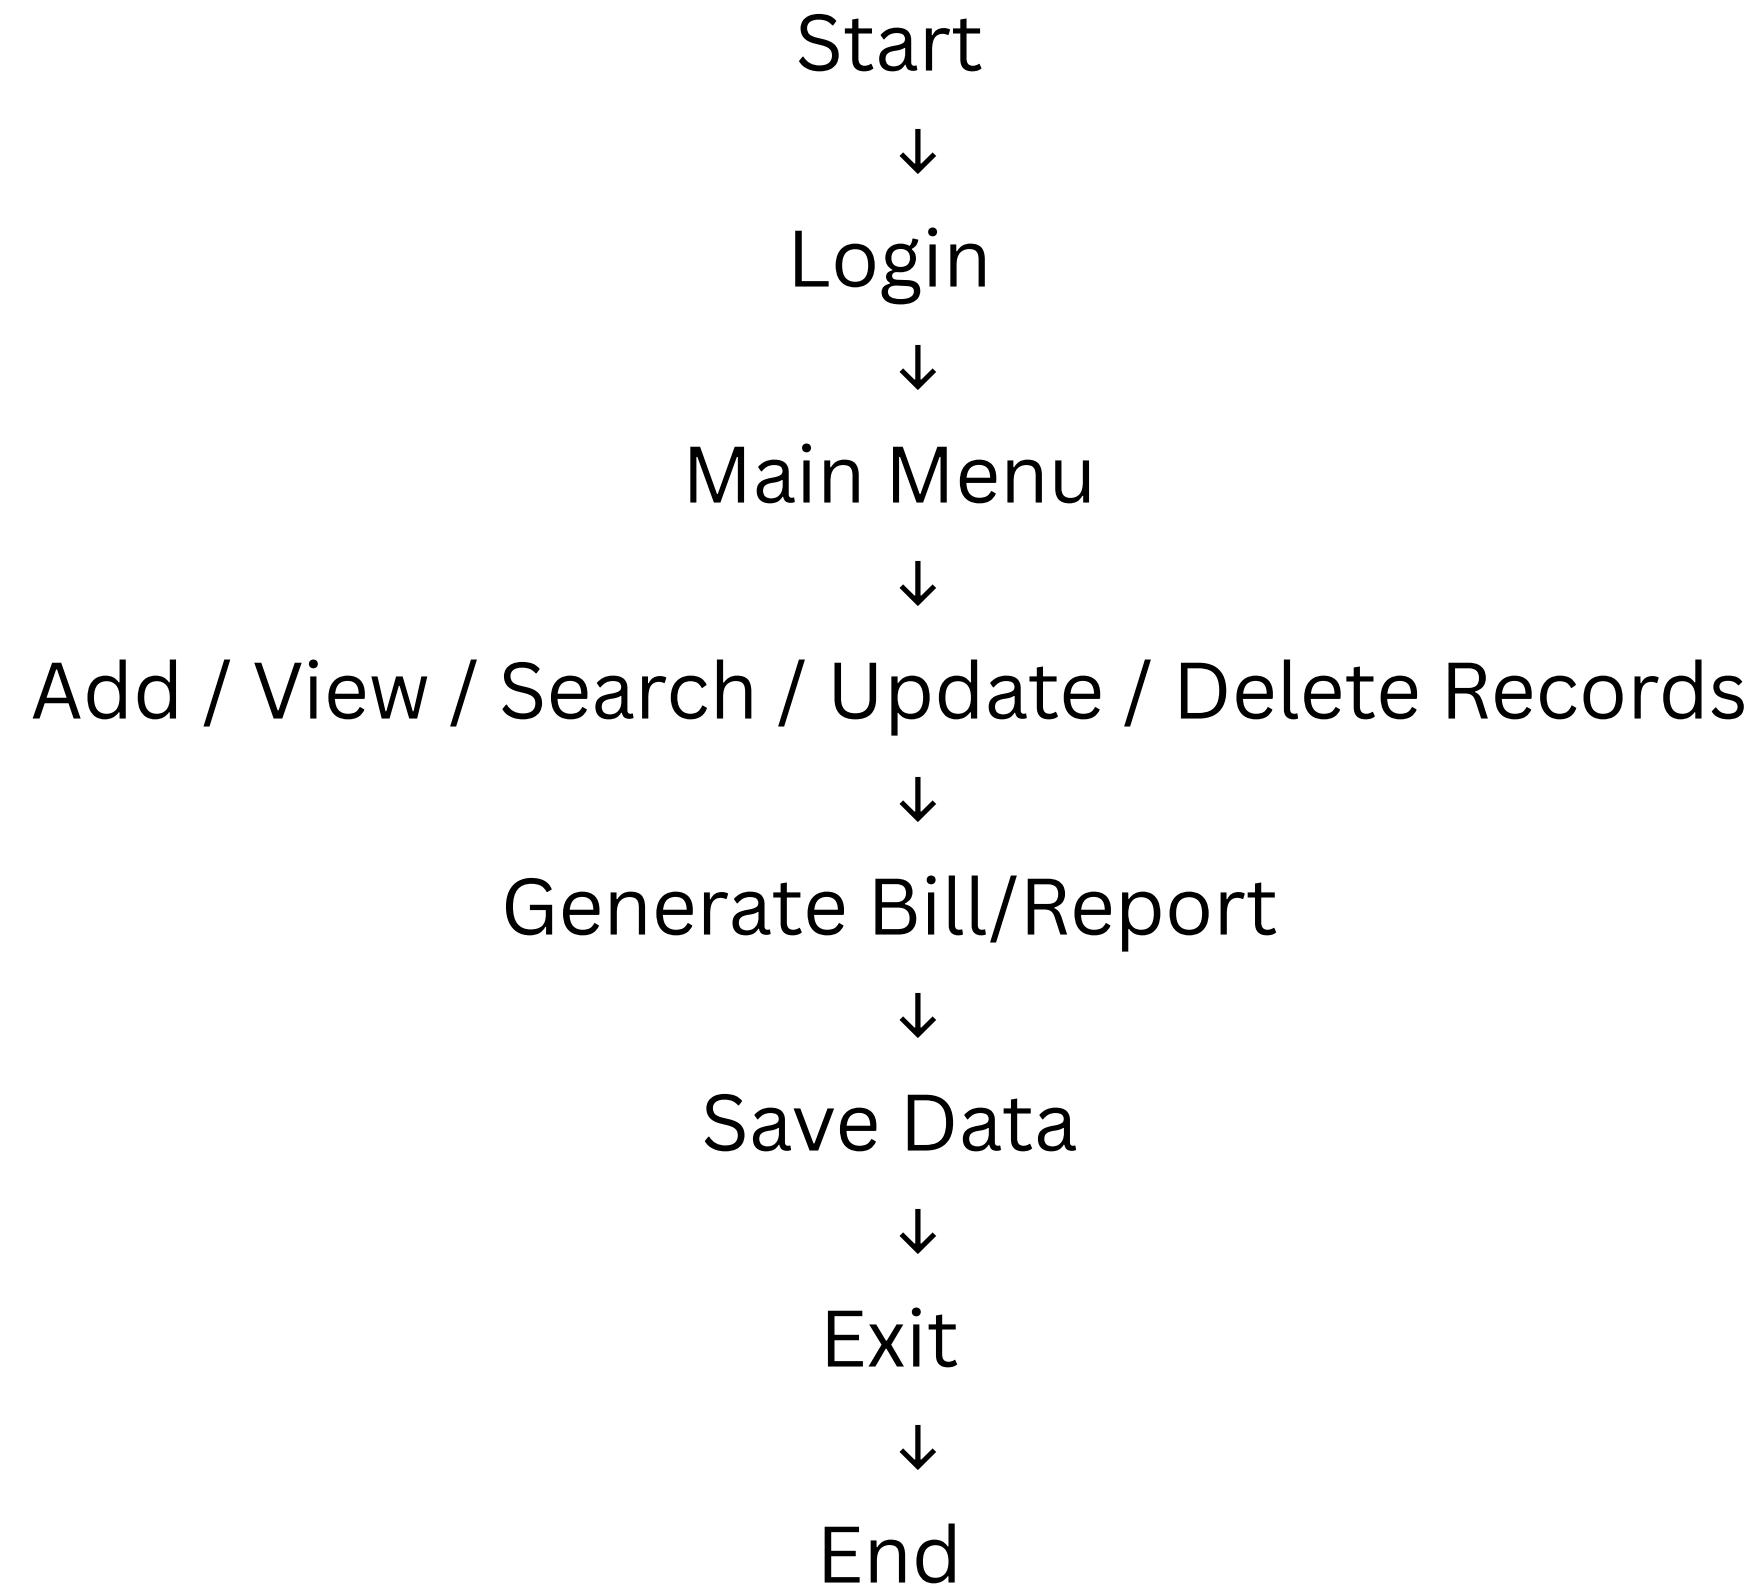

2. Proposed System

- 1.The proposed Hospital Management System is a computerized application that manages hospital operations efficiently.
- 2.It stores patient, doctor, appointment, billing, and medical records in a centralized database.
- 3.The system provides quick access to information and reduces manual work.
- 4.It improves accuracy, security, and overall hospital management.

3. Advantages

- 1.Faster patient registration and record management.
- 2.Easy appointment scheduling.
- 3.Accurate billing with fewer errors.
- 4.Secure storage of hospital data.
- 5.Quick report generation.
- 6.Saves time and reduces paperwork.
- 7.Improves overall efficiency.

4. Flowchart

5. Conclusion

- 1.The Hospital Management System simplifies hospital operations by automating patient, doctor, appointment, and billing management.
- 2.It reduces paperwork, improves data accuracy, saves time, and provides secure record storage.
- 3.The system helps hospitals deliver faster and better healthcare services.

THANK YOU!
